Covid-19 primarily spreads from person to person. When someone sick sneezes, coughs or talks, droplets containing the virus are released into the air and can land on eyes, nose and mouth where they can then enter the body of those nearby.

To protect yourself and others from these droplets, wear a mask and stay 6 feet apart!

Infected droplets can also land on surfaces and be left on objects.

If you touch those surfaces or objects, you can pick up the virus. *It is important to wash your hands often, sanitize surfaces and avoid touching your face!*
